of a solder powder and a solder flux or vehicle system. These two materials are blended together according to established procedures. The resultant properties of the solder paste are directly established by the raw materials utilized. Control of the raw material characteristics are key to controlling the final properties of the solder paste.

not always the case. Excessive IMCs in solder joints are a bad thing since they significantly alter both the composition and the mechanical performance of the solder joint. Interfacial IMC layers can be an indication of the quality of the solder joint and the lack of them would indicate a solder process or possibly a material problem.
